(54) Hard surface cleaner including urea

(57) A substantially homogeneous, solid block cleaning composition, preferably held in a plastic container, comprises an acid, either organic or inorganic, urea and a surfactant or mixtures of cationic nonionic or anionic surfactants. The acid is preferably a combination of a solid acid, eg citric acid, and a liquid acid, eg hydroxyacetic acid.

SOLID ACID CLEANING BLOCK AND METHOD OF MANUFACTURING

Field of the Invention

5 The invention relates to improved cleaning compositions for hard surfaces and methods of their manufacture. Further, the invention also relates to solid block cleaning compositions containing acidic components. Still further, the invention relates to
10 acidic solid block cleaning compositions that can contain a variety of optional ingredients which may be used to enhance or broaden the soil removing activity of the acid components. The invention also relates to methods of cleaning hard surfaces comprising dispensing
15 a concentrate by contacting the acid block detergent with an aqueous spray, diluting the concentrate with an appropriate amount of an aqueous diluent to produce an acid cleaning product and applying the product to a soiled surface to remove the soil.

20

Background of the Invention

Hard surface cleaners useful in institutional and non-institutional environments may take any number of forms. Typically these cleaners are liquid formulations
25 as either a non-aqueous, organic cleaner formulation, or aqueous cleaner formulations that can be neutral, acidic or alkaline in pH when diluted to use solutions. Organic cleaner formulations are commonly prepared in an organic base material such as a solvent or surfactant
30 base. Further these formulations may comprise a variety of ingredients such as sequestrants, rust inhibitors, etc.

Aqueous, neutral, acid, or alkaline cleaners, in use solution concentrations, are typically formulated,
35 using a major proportion of an aqueous diluent and minor, but effective amounts, of surfactants, cosolvents and sequestrants. In large part, these cleaners can be used in the form of an aqueous liquid concentrate that is diluted with water to form the use solution. These

dilute liquid cleaning formulations have been useful in a number of cleaning environments. However, dilute liquid cleaning formulations that contain a substantial proportion of an aqueous or organic diluent often
5 entails large transportation costs to move solvent or water. Further, cleaning concentrates in liquid form can often be contaminated or can in some cases deteriorate, phase separate and become useless. Further, liquid materials can spill, splash or otherwise
10 be misused resulting in a safety hazard in contact between users and the alkaline or acid concentrate materials.

A number of aqueous acidic cleaners have been disclosed in the prior art. While there are a large
15 number of patents teaching acid cleaners, the following are representative. Casey, U.S. Pat. No. 4,587,030 teaches a foamable acidic liquid cleaning composition adapted for cleaning soap scum and other hardness components from hard surfaces. The cleaners contain a
20 mixture of oleic organic acid and oleic inorganic acid, a surfactant system and a cosolvent that is particularly adapted to removing soap scum that forms in kitchens, baths, etc. Copeland, U.S. Pat. No. 4,769,159 teaches an institutional fabric softening containing cationic
25 surfactant and organic acid in the form of a stable solid block material comprising acidic fabric softening components. Cockrell, Jr. et al., U.S. Pat. Nos. 4,877,459 and 4,749,508 teach liquid acidic materials for cleaning hard surfaces and in particular quarry tile
30 surfaces. The patents teach specific compositions and generic methods using an acid cleaner for soil removal. Gladfelter, U.S. Pat. No. 5,198,198 teaches generic cleaner compositions manufactured in the form of a pellet material formed inside a water soluble bag. The
35 pellets can have acid components. Inorganic alkaline cast solid materials can be formed using known technologies. Fernholz, U.S. Reissue Patent No. 32,818

teaches a solid block detergent containing large proportions of caustic. Morganson et al, U.S. Patent No. 4,624,713 teaches a solid rinse agent containing a rate dispensing agent for varying the release of the surfactant rinse agent. Heile et al., U.S. Pat. No. 4,680,134 and 4,595,520 teaches a lower alkaline detergent which optionally contains various inorganic solids. Solid inorganic fertilizer materials are disclosed in Jordan et al., U.S. Pat. No. 4,175,943; Corver et al., U.S. Pat. No. 4,260,592 and Khasawneh, United States Defensive Publication No. T102902. These patent disclosure documents are primarily directed to particulate inorganic fertilizer compositions containing a blend of materials optimized for fertilizing growing plant tissue. These formulations are not highly acid, nor do they contain components that contribute the cleaning performance of acidic cleaners.

While liquid aqueous acidic cleaners have had success in removing soil from a variety of hard surfaces, the aqueous liquid materials still pose a substantial drawback to a user based on both economic and safety considerations. Accordingly, a substantial need exists in improving acid cleaners to render them more cost effective and safe.

25

Brief Discussion of the Invention

The invention comprises a solid block acid cleaner comprising a solid matrix including a blend of an acid cleaner component, a surfactant composition selected from the group consisting of an anionic surfactant, a nonionic surfactant or mixtures thereof, and a binding agent or solidification compound resulting in a solid mass of about 100 grams or more. The invention also resides in a preferred solid block acid cleaner composition comprising an acid source which is a solid or substantially a solid at any temperature less than 40°C, and an acid which can exist as a liquid at a

temperature less than about 40°C, a surfactant composition having a nonionic selected from the group consisting of an alcohol ethoxylate, a nonylphenol ethoxylate, an ethoxylated/propoxylated copolymer, and mixtures thereof, and an anionic surfactant selected from the group consisting of alkylsulfate or sulfonate, arylsulfate or sulfonate, alkylaryl sulfate or sulfonate, and mixtures thereof and a solidification compound preferably urea, wherein said solid block acid cleaning composition has a pKa ranging from about 1 to 3. The invention also includes methods of use and manufacture for the composition of the invention.

We have found a unique product format comprising a solid block cleaner composition that when diluted with water (at about 1 wt-% active aqueous solution) produces a product or use solution that exhibits a pH less than about 6. The solid block detergent can contain acids that are normally liquid and acids that are normally solid at room temperature. The solid matrix can be dispensed from the solid state to form an aqueous concentrate having a substantial proportion of acid components plus other additives that can enhance or extend the performance of the acid cleaner material. Such concentrate materials can be further diluted with water to form a use solution. In use, the composition of the invention may be applied to any number of surfaces including floors, counter tops, cleaning and food preparation surfaces, among other materials. Such use solutions can be applied to a variety of hard surfaces in the institutional, hospitality or industrial markets for removal of a variety of soil types.

Further, the invention relates to methods of manufacturing a solid block acid cleaner material. Such materials can contain one or more sources of acidity, solvent or co-solvent, additive detergent or surfactant materials and a solidification agent. The formulated acidic material solidifies through the interaction of

the intentionally blended components and can be solidified within a disposable container, a film, a water soluble wrapping material or can be packaged in other convenient packaging material. For the purpose of the materials used in making the acid cleaner of the invention and the acid cleaner of the invention, a "solid" is a composition that, at use temperature, is sufficiently resistant to flow that the unsupported composition will not substantially change shape upon standing. Such a solid can be in the form of a matrix including a hard block or brick or a deformable but rigid aqueous dispersion or hard gel. For the purposes of this invention, a liquid is a material that flows at a substantial rate, at use temperature, such that the unsupported material (removed from a container) will lose its shape upon standing in less than one minute. A matrix can comprise a solid mass or a solidified blend of materials having various particle sizes and states of solidification and can comprise liquid components in the solid in a form and concentration that do not interfere with maintaining a stable solid. The matrix can be made by casting, compressing, pelletizing, etc.

Detailed Discussion of the Invention

The invention comprises a solid acid cleaner, a method for its manufacture, and a method of its use.

The Solid Acid Cleaner

The acid cleaner of the invention generally comprises a binding agent, a surfactant composition, and an acidulant or acid source. As a binder or solidification agent, this acid cleaner generally comprises one or more constituents which function to provide a semi-solid or solid consistency to the composition. Any number of binding agents can be used in accordance with the invention. One preferred binding agent is urea. Urea has been found to bind both the acidulant and surfactant composition to provide an

aqueous soluble, dispensable solid matrix. While the binding mechanism is not fully understood, urea appears to act through an inclusive mechanism with both the acidulant and surfactant. Inclusion as used herein
5 generally describes the function of complexing between two or more constituents to form an adduct. Generally, the urea complex has two compounds that form a crystalline material. Urea will form inclusion complexes with hydrocarbons, alcohols, fatty acids,
10 fatty esters, polyoxyalkylene polymers such as polyethylene glycols and other compounds. The inclusion complexes have been described as host-guest relation, where urea is the host, and it wrap itself around the guest molecule.

15 In the context of interactions between the binding agent and surfactant, the inclusive action takes the form of a micellar interaction between the polar urea and the polar portions of the surfactants. With regard to the action or interaction between the binding agent
20 and the acid source, the interaction may be characterized as an acid-based attraction between urea and the acid source. The urea reacts with the surfactant to form crystalline urea adducts or inclusion compounds, wherein the urea molecules are wrapped in a
25 spiral or helical formation around the molecules of surfactant. Generally, urea will form inclusion compounds with long straight-chain molecules of 6 or more carbon atoms but not with branched or bulky molecules.

30 The acid cleaner compositions of the invention can comprise up to about 50% by weight urea. Typically, the compositions will have a minimum of about 10% by weight urea. We have found that the preferred compositions, for reasons of economy, desired hardness and solubility,
35 comprise about 15% to 40% by weight urea. Most preferably, the compositions generally comprise about 20% to 30% by weight urea. Urea may be obtained from a

variety of chemical suppliers, including Sohio Chemical Company, Nitrogen Chemicals Division. Typically, urea will be available in prilled form, and any industrial grade urea may be used in the context of this invention.

- 5 The particle size of the urea material before blending in the compositions of the invention, is generally between about 200 and 4000 μ .

The composition of the invention also generally comprises a surfactant. This surfactant may include any
10 surfactant constituent or constituents, including compounds, polymers and reaction products. Surfactants function to alter surface tension in the resulting compositions, assist in soil removal and suspension by emulsifying soil and allowing removal through a
15 subsequent flushing or rinse. Any number of surfactants may be used including organic surfactants such as anionic surfactants, cationic surfactants, nonionic surfactants, amphoterics and mixtures thereof.

Anionic surfactants are useful in removing oily
20 soils. Generally, anionic surfactants have a more hydrophobic nature which allows their use in cleaning operations including hard surface washing and laundry operations, intent on cleaning objects with oil sediments. Anionic surfactants useful in the invention
25 include sulfates, sulfonates, and carboxylates such as alkyl carboxylates salts, among others. Exemplary anionic surfactants, include alkyl sulfates and sulfonates, alkyl ether sulfates and sulfonates, alkyl aryl sulfates and sulfonates, aryl sulfates and
30 sulfonates, and sulfated fatty acid esters, among others. Preferred anionic surfactants include linear alkyl sulfates and sulfonates, and alkyl benzyl sulfates and sulfonates. More preferably the alkyl group in each instance has a carbon chain length ranging from about C₈.
35 ₁₈, and the preferred aryl group is benzyl.

Nonionic surfactants which have generally been found to be useful in the invention are those which

comprise ethylene oxide moieties, propylene oxide moieties, as well as mixtures thereof. These nonionics have been found to be pH stable in acidic environments, as well as providing the necessary cleaning and soil
 5 suspending efficacy.

Nonionic surfactants which are useful in the invention include polyoxyalkylene nonionic surfactants such as C₈₋₂₂ normal fatty alcohol-ethylene oxides or propylene oxide condensates, (that is the condensation products of one
 10 mole of fatty alcohol containing 8-22 carbon atoms with from 2 to 20 moles of ethylene oxide or propylene oxide); polyoxypropylene-polyoxyethylene condensates having the formula $\text{HO}(\text{C}_2\text{H}_4\text{O})_x(\text{C}_3\text{H}_6\text{O})_y\text{H}$ wherein $(\text{C}_2\text{H}_4\text{O})_x$ equals at least 15% of the polymer and $(\text{C}_3\text{H}_6\text{O})_y$ equals
 15 20-90% of the total weight of the compound; alkylpolyoxypropylene-polyoxyethylene condensates having the formula $\text{RO}-(\text{C}_3\text{H}_6\text{O})_x(\text{C}_2\text{H}_4\text{O})_y\text{H}$ where R is a C₁₋₁₅ alkyl group and x and y each represent an integer of from 2 to 98; polyoxyalkylene glycols; butyleneoxide capped
 20 alcohol ethoxylate having the formula $(\text{R}(\text{OC}_2\text{H}_4)_y(\text{OC}_4\text{H}_9)_x\text{OH})$ where R is a C₈₋₁₈ alkyl group and y is from about 3.5 to 10 and x is an integer from about 0.5 to 1.5; benzyl ethers of polyoxyethylene and condensates of alkyl phenols having the formula $\text{R}(\text{C}_6\text{H}_4)(\text{OC}_2\text{H}_4)_x\text{OCH}_2\text{C}_6\text{H}_5$ wherein
 25 R is a C₆₋₂₀ alkyl group and x is an integer of from 5 to 40; and alkyl phenoxy polyoxyethylene ethanols having the formula $\text{R}(\text{C}_6\text{H}_4)(\text{OC}_2\text{H}_4)_x\text{OH}$ wherein R is a C₈₋₂₀ alkyl group and x is an integer from 3 to 20. Two specific types of nonionic surfactants have been found to be
 30 preferable as effective soil suspending agents in the solid and cleaning composition of the invention. First, polyoxypropylene-polyoxyethylene block polymers have been found to be useful in the invention. These polymers generally have the formula:

in which on the average $x = 0-150$, preferably, $2-128$, $y = 0-150$, and preferably $16-70$, and $z = 0-150$, and preferably, $2-128$. More preferably, the polyoxypropylene- polyoxyethylene block copolymers used
 5 in the invention have a $x = 2-40$, a $y = 30-70$ and a $z = 2-40$. Block nonionic copolymers of this formula are desirable for various applications due to the reduced foaming characteristics these provide. A second and preferred class of nonionic surfactants which is useful
 10 in the invention and desirable for other applications are alcohol ethoxylates. Such nonionics are formed by reacting an alcoholate salt ($RO-Na^+$) wherein R is an alcohol or alkyl aromatic moiety with an alkylene oxide. Generally, preferred alkoxyates are C1-12 alkyl phenol
 15 alkyloxyates such as the nonyl phenol ethoxylate which generally have the formula:

20 where n may range in value from 6 to 100. Alkyl moieties including a nonyl phenol ethoxylate having an ethoxylate molar value ranging from about 6 moles to 15 moles have been found preferable for reasons of low foaming character and stability in the acidic
 25 environment provided by the composition of the invention.

One particularly useful surfactant for use in acid systems include the amine oxide surfactants. Useful amine oxide surfactants have the formula:

30 wherein R_1 is a C_8-C_{20} -alkyl or C_8-C_{20} -alkylamido- C_2-C_5 -alkyl group and R_2 and R_3 are individually C_1-C_4 -lower alkyl or hydroxy- C_1-C_4 -lower alkyl. Preferably R_2 and R_3 are both methyl, ethyl or 2-hydroxyethyl. Preferred
 35

- members of this class include lauryl(dimethyl)amine oxide (Ninox[®] L, Stephan Chemical Co., Northfield, IL), cocodimethyl amine oxide (Ninox[®] C), myristyl(dimethyl)amine oxide (Ninox[®] M),
- 5 stearyl(dimethyl)amine oxide (Schercamox[®] DMS, Scher Chemicals, Inc., Clifton, N.J.), coco(bis-hydroxyethyl)amine oxide (Schercamox[®] CMS), tallow(bis-hydroxyethyl)amine oxide and cocoamidopropyl(dimethyl)amine oxide (Ninox[®] CA).
- 10 Although in alkaline solutions these surfactants are nonionic, in acidic solutions they adopt cationic characteristics. Preferably, the amine oxide surfactants will comprise about 1-15% of the present compositions, most preferably about 2-10%
- 15 Cationic surfactants may also be used in the acid cleaner of the invention quaternary ammonium compounds. Also useful as antimicrobials in the invention are cationic surfactants including quaternary ammonium chloride surfactants such as N-alkyl(C₁₂₋₁₈)
- 20 dimethylbenzyl ammonium chloride, N-tetradecyldimethylbenzyl ammonium chloride monohydrate, N-alkyl(C₁₂₋₁₄) dimethyl 1-naphthylmethyl ammonium chloride available commercially from manufacturers such as Stepan Chemical Company.
- 25 The surfactant or surfactant system will comprise up to about 70% by weight of the total acid cleaning composition. Typically, the weight-percent surfactant will be in the range of about 10%-15% by weight, or more preferably, for improved cleaning efficacy, in the range
- 30 of about 20%-40% by weight.
- The surfactant composition can comprise a mixture nonionic and anionic surfactants. Preferably, the nonionic surfactant will comprise a C₆₋₁₂ alkyl phenol ethoxylate comprising from about 5-15 moles of EO and
- 35 the anionic surfactant is preferably a linear alkyl sulfate or sulfonate with an alkyl chain of about C₈₋₁₈. Overall, the surfactant composition comprises from

about 10-70% by weight and the anionic surfactant comprising about 0-60%, most preferably 1-55% by weight of the entire composition in this preferred mode.

The acid cleaning composition of the invention also
5 contains an acidulant or acid source. The acid source can comprise a single source. The source can be a liquid or a solid acid or a mixture thereof. The liquid acid can be a normally liquid material or an aqueous acid composition. The acidulant functions to produce a
10 pH in the diluted use composition of less than 6.5 and, in turn, increase the cleaning efficacy of the composition. In the context of this invention, cleaning efficacy generally means the ability to clean hard surfaces including the removal of organic waste such as
15 greases, oils, and fatty soils. The acidulant may also function to facilitate removal of salt and scale buildup on application surfaces such as floor and waste areas exposed to the composition.

Generally, any normally liquid or normally solid
20 acid source which will facilitate the formation of a solid product, may be used in the composition of the invention. Both organic and inorganic acids have been found to be generally useful in the present composition. Organic acids useful in accordance with the invention
25 include hydroxyacetic (glycolic) acid, citric acid, formic acid, acetic acid, propionic acid, butyric acid, valeric acid, caproic acid, gluconic acid, and itaconic acid, trichloroacetic acid, benzoic acid, among others. Organic dicarboxylic acids such as oxalic acid, malonic
30 acid, succinic acid, glutaric acid, maleic acid, fumaric acid, adipic acid, terephthalic acid among others are also useful in accordance with the invention. Any combination of these organic acids may also be used intermixed or with other organic acids which allow
35 adequate formation of the composition of the invention. Inorganic acids useful in accordance with the invention include phosphoric acid, sulfuric acid, sulfamic acid,

methysulfamic acid, hydrochloric acid, hydrobromic acid, and nitric acid among others. These acids may also be used in combination with other inorganic acids or with those organic acids mentioned above.

5 In accordance with a preferred aspect of the invention, the acidulant source used in the invention will comprise a combination of liquid or solution based acid source and solid acid source. The concentration of the acid as a percentage of the entire composition will
10 generally vary from about 10 to 80 % by weight preferably from about 20 to 60% by weight, and most preferably from about 30 to 50 % by weight. Of this composition, about 0 to 80 % by weight preferably about 1 to 60 % by weight, and most preferably about 1 to 40
15 % by weight comprise solid acid with the balance being a liquid or solution-based source of acid.

Further, we have found that a combination of 10 wt% to 35 wt% of a solid acid preferably citric acid combined with 10 wt% to 25 wt% of a liquid acid source,
20 preferably hydroxy acetic (glycolic) acid (40-75% w/v aqueous) as a total percentage of the acid concentration and the composition provides the most preferred solid acid cleaning composition. The useful ranges of materials are displayed in the following table. Only
25 the acid, some proportion of surfactant, water and urea are required. The amount of water used to obtain the best quality and dispensible solid falls in the range of weight ratios of about 1 to 6 parts of urea per each part of water.

Solid Acid Cleaner Compositions

15

The Method of Manufacturing

The acid cleaner of this invention may be manufactured or formulated through any number of processes. Processes such as conventional batch

20 processing (in line mill optionally and for particular size adjustment), extrusion processing, semi-continuous processing, are all useful methods of formulating the composition invention. One preferred method of formulating the composition of the invention is a semi-

25 continuous method using an in-line mill to obtain a preferred partial size range for blending and solidification, less than 1000 μ , and most preferably about 100 to 2000 μ . In this method, all raw materials except for the urea are combined in a large stock tank.

30 A stub batch is prepared by pumping a portion (5-20 wt%) of the original material from the stock tank into a premix tank. The entire urea amount is added to the

¹ Total surfactant.

² Total water, same water may be derived from the other ingredients. Total water content in about 1

35 part water per each 1-6 parts urea.

premix tank and the urea is incorporated into the liquid. After reaching uniformity, the mixture is diverted to an in-line mill. After milling the mixture is combined with the balance of the composition and is placed in a plastic capsule (sized to include about 1-10 lbs. (about 0.5 to 5 kg) of mixture for solidification. Alternatively, with or without milling, the urea and the mixture can be heated and mixed until uniform and can be placed into a plastic capsule for cooling and solidification.

When milling to control particle size, once the mill is started, the liquid raw material and urea are fed continuously into the pre-mix tank. The rate of continuous feeding to the pre-mix tank and fill rate from the pre-mix tank should be set so that the liquid level in the tank is maintained at a constant volume. This level should be set at the minimum volume in which the urea can be suspended. The temperature of the pre-mix tank should be about 165°F, preferably between 150-170°F. The stock temperature should be maintained at 120-175°F.

The maintenance of this temperature will preclude the liquid from solidifying in the pre-mix tank. Agitation both in the stock tank and in the pre-mix tank should be kept at a minimum. Preferably, the pipelines between the tanks and the filler will be warmed prior to use. All filled containers are passed through an air cooler immediately after filling for a minimum of 15 minutes.

In greater detail, the invention may be formulated in an alternative manner by, charging the liquid acid into a mixing tank and initiate heating to 200°F. During this heating period, the tank is initially charged with the intended volume of solid and liquid acid. The acids are mixed at 200°F until all of the acid source is dissolved within the liquid acid source. Once the acid sources are dissolved, the tank may then

be charged with the surfactant. Once mixed for an effective period of time, usually about 15 minutes, the tank is then heated as necessary to attain a temperature of 180°F.

5 At this time, urea, preferably in prilled form is charged into the tank. The tank is preferably maintained at a temperature of 175°F throughout the addition. Once the mixture obtains a homogeneous consistency, the composition may then be decanted into
10 filling vessels. Preferably the cooling time of the mixed acid composition is about 30 to 60 min. and most preferably about 40 to 50 min. so as to reduce the level of expansion in the urea product.

 Once formulated, the composition of the invention
15 may be dissolved to provide a use-dilution for any number of applications including institutional applications, hospitality applications, kitchen applications, etc. The use-dilution table may be found below at table 2.

20

OBJECTIVE:

Two samples of an acid floor cleaner were submitted for the determination of any sanitizing capabilities.

5 TEST PROCEDURE:

Test Method: Germicidal and Detergent Sanitizing
Action of Disinfectants - Final Action
(Test Procedure No. AOAC 960.09
10 Germicidal and detergent sanitizing
action of disinfectants)

Test Substance: Staphylococcus aureus ATCC 6538
Escherichia coli ATCC 11229

15 Exposure Times: 30 seconds, 1 minute, and 5
minutes

Test Temperature: 25°C

20 Neutralizer: Chamber's Neutralizer

Subculture Media: Tryptone Glucose Extract Agar

25 Incubation: 37°C for 48 hours

Results:

STAPHYLOCOCCUS AUREUS INOCULUM = 37×10^6 cfu/ml

30

Sample	Exposure	Survivors /ml	% Reduction	Post Test pH
A @ 0.5%	30 seconds	$<1 \times 10^1$	>99.999	2.52
	1 minute	$<1 \times 10^1$	>99.999	
	5 minutes	$<1 \times 10^1$	>99.999	
35 B @ 0.5%	30 seconds	207×10^5	44.054	2.50
	1 minute	103×10^5	72.162	
	5 minutes	172×10^3	99.535	

ESCHERICHIA COLI INOCULUM = 90×10^6 cfu/ml

Sample	Exposure	Survivors /ml	% Reduction	Post Test pH
5 A @ 0.5%	30 seconds	36×10^1	>99.999	2.41
	1 minute	$<1 \times 10^1$	>99.999	
	5 minutes	$<1 \times 10^1$	>99.999	
B @ 0.5%	30 seconds	415×10^5	53.889	2.45
	1 minute	443×10^5	50.778	
	5 minutes	360×10^5	60.000	

Raw Materials		A	B
10	C ₁₂ Alcohol (23 mole) Ethoxylate Alcohol Ethoxylate	10.00	21.00
	Pluronic F-85 EO/PO Block Polymer	5.00	3.00
	Linear Alkyl Benzene Sulfonic Acid	9.00	
	Urea	23.50	23.50
15	Citric Acid	30.00	30.00
	Glycolic Acid (70%) Active Aqueous	22.50	22.50
	Totals	100.00	100.00

20 Conclusions: Acid floor cleaner sample PO6144A
 demonstrated sanitizing efficacy against
 both Staphylococcus aureus and
 Escherichia coli after 30 seconds
 exposure. Acid floor cleaner sample
 25 PO9204A demonstrated little or no
 efficacy against either organism after 5
 minutes. Activity against Escherichia
 coli was worse than against
 Staphylococcus aureus.

We have found that the compositions of the invention are particularly useful in cleaning soils comprising food residue in combination with inorganic components. In particular, the compositions of the invention are useful in cleaning hard surfaces such as sinks, counters, floors, walls, tables, etc. that can accumulate substantial residues of soil comprising carbohydrate residue, protein residue, fatty soil residue comprising neutral fats, fatty acids and calcium, sodium, potassium, salts or fatty acids in combination with hardness components derived from common utility service water. In particular, such complex soils can form on hard floor surfaces such as grouted quarry tile surfaces. Such surfaces that can be formed on walls, countertops or floors can have soiled quarry tile and substantial quantities of soil on grout lines form around the quarry tile. The compositions of the invention can be used in the method of cleaning such surfaces that can remove substantial proportions of soil rendering the floor substantially clean. The cleanliness of the floor is characteristic of a substantially improved coefficient of friction (COF). A coefficient of friction greater than about 0.5 and preferably greater than about 0.4 connotes a non-slip floor of substantially improved safety when compared to slippery soiled floor surfaces. Further, the floors can be characteristically free of soil residue as measured by FTIR (Fourier Transform Infrared Spectra Technology) which is a surface scanning technology adapted for the analysis of surface residues.

We have also been using more conventional testing methods that substantial quantities of calcium fatty acid salts in combination with fatty acids and other residues derived from food sources can readily be cleaned from floor surfaces using the compositions of the invention. Typically, the compositions of the invention can clean from hard floor surfaces, or other

hard surfaces, greater than 60%, typically 70-85% of such soils from these common hard surfaces. The following procedure is a typical procedure for measuring the removal of a synthetic soil from hard surfaces.

5

Kitchen Floor Soil
Gardner Straight Line Soil Removal Test Procedure

- 10 PURPOSE: To compare the cleaning efficiencies of various detergent formulations. This test may be used to compare competitive products to Ecolab products.
- 15 PRINCIPLE: Quarry floor tiles are baked at 200°F for 2 hours with a soil mixture that reproduces soil found on a restaurant kitchen floor. Tiles are then read on the UltraScan Spectrophotometer instrument before and after the test
- 20 procedure.

The Gardner Straight Line Washability apparatus, Model WG 8100 is used to clean the soled tiles using a nylon brush (from Gardner), using use dilution concentrations

25 of detergents.

APPARATUS AND MATERIALS:

1. Gardner Straight Line apparatus with plastic template, 21-15/16" x 6-15/16" x 1/2". Two holes 3-1/16" x 3-1/16".
- 30 2. UltraScan Spectrophotometer instrument. See the attached UltraScan setup sheets.
- 35 3. Cream, solid quarry tile, 3" x 3" panels. Supplier: Color Tile, St. Paul, MN.
4. Paint brush, 1" width (not nylon).
- 40 5. Gardner Straight Line brush (two brushes joined together 2-3/4" W x 3-1/2" L).
6. Balance.
- 45 7. Graduated cylinder (200 mls).
8. Oven (preheated to 200°F).

TITLE SOILING PROCEDURE:

- 5 1. If using the UltraScan to obtain data, an initial reading of the tiles is needed. Read the smooth side of the quarry tiles (4 tiles for each product concentrated tested).
- 10 2. Mix the soil, such as a calcium fatty acid soil, well before applying to the tile, maintaining the consistency of the soil that is needed to spread over the tile. Place tile on the balance and tare. Apply -2.0 grams of soil and using the paint brush spread it over the surface stroking in one
- 15 direction and then turn the tile and crisscross over the strokes.
- Soil only enough tiles that will be needed for the test.
- 20 3. Place the files in the oven (preheated to 200°F) and bake for 2 hours. Remove and let sit overnight (tiles should not be kept or used after 1 day).

25

SOIL REMOVAL TEST PROCEDURE:

- 30 1. Make up test solutions typically at 2 oz/gal (1.5 wt%) use the appropriate water for your testing. Once a water has been selected it should be used throughout the test.
- 35 2. Place the plastic template inside the Gardner Straight Line and place the brush into the housing box.
- 40 3. Place 2 soiled tiles into the template openings.
4. With the graduated cylinder pour 200 mls of the test solution into the tray.
5. Start the machine immediately, washing the tiles for 32 passes (rotate tile after every 8 passes).
- 45 6. Remove the brush and tiles and rinse them with warm water.
7. Air dry tiles.

RECORDING DATA:

- 5 Use appropriate Ultrascan machine set-up and record Ultrascan reading before (B) and after (A) cleaning soiled tile.

A = After

10 B = Before

CALCULATIONS:

15
$$(A-B)/(Initial:B) \times 100 = CE$$

INTERPRETATION OF RESULTS:

- 20 To eliminate variations from one batch of soil to another and the variations in application from one tester to another, do not compare results for similar products unless tests are run on the same day with the same soil and the same person performing the test procedure. This is an empirical test good only for
- 25 comparison purposes. Add to the test a product that has a known result as a comparison to all other detergents run during each testing run.

The above, discussions, examples and data represent
are our current understanding of the invention.
However, since many variations of the invention can be
5 made without departing from the spirit and scope of the
invention, the invention resides in the claims
hereinafter appended.

WE CLAIM:

1. A solid block acid cleaner composition the block comprising:
 - 5 (a) an effective amount of an acid component;
 - (b) an effective soil suspending amount of a surfactant composition; and
 - (c) an effective solidifying amount of a urea compound; wherein the composition is held within a
 - 10 disposable plastic container.
2. The composition of claim 1 wherein said acid composition is selected from the group consisting of an inorganic acid, an organic acid, and mixtures thereof.
- 15 3. The composition of claim 2 wherein said inorganic acid is selected from the group consisting of phosphoric acid, sulfuric acid, sulfamic acid, hydrochloric acid, hydrobromic acid, nitric acid, and
- 20 mixtures thereof.
4. The composition of claim 2 wherein said organic acid is selected from the group consisting of hydroxyacetic acid, citric acid, formic acid, acetic
- 25 acid, propionic acid, butyric acid, valeric acid, caproic acid, gluconic acid, itaconic acid, oxalic acid, malonic acid, succinic acid, glutaric acid, maleic acid, fumaric acid, adipic acid, methyl sulfamic acid and mixtures thereof.
- 30 5. The composition of claim 1 wherein said acid cleaner component comprises a mixture of an acid which is a solid at a temperature less than about 40°C combined with an acid which can be a liquid at a
- 35 temperature of less than about 40°C.
6. The composition of claim 5 wherein said solid

acid comprises 0.1 to 80 wt% of the cleaner composition said liquid acid comprises 10-80 wt% of the cleaner composition, and said block comprises about 10-45 wt% urea.

5

7. The composition of claim 6 wherein said solid acid has a concentration ranging from about 10 to 80 wt% of the acid cleaner composition and said liquid acid has a concentration ranging from about 10 to 70 wt% of the acid cleaner composition.

10

8. The composition of claim 6 additionally comprising a defoamer.

15

9. The composition of claim 1 wherein said surfactant composition is selected from the group consisting of a nonionic surfactant, an anionic surfactant, a cationic surfactant, and mixtures thereof.

20

10. The composition of claim 9 wherein said nonionic surfactant is selected from the group consisting of an alcohol ethoxylate, an ethoxylated-propoxylated copolymer, a nonyl phenol ethoxylate, and mixtures thereof.

25

11. The composition of claim 9 wherein said anionic surfactant is selected from the group consisting of an alkyl sulfate or sulfonate, an aryl sulfate or sulfonate, an alkyl aryl sulfate or sulfonate, and mixtures thereof.

30

12. The composition of claim 1 wherein said surfactant composition comprises a mixture of nonionic surfactant and anionic surfactant, said nonionic surfactant comprising an alcohol ethoxylate, a nonylphenol ethoxylate and said anionic surfactant

35

comprising a linear alkyl sulfate or sulfonate.

13. The composition of claim 12 wherein said
surfactant composition comprises about 10 to 70 wt% of
5 said acid cleaner composition.

14. The composition of claim 13 wherein the
surfactant composition further comprising about 0.1 to
60 wt% of an alkyl sulfonate and from about 10 to 70 wt%
10 of a nonionic comprising a C₆₋₁₈ alcohol ethoxylate or a
C₆₋₁₂ alkylphenol ethoxylate.

15. The composition of claim 1 wherein upon
diluting to 10 wt% aqueous or less said acid composition
15 has a pKa less than about 6.

16. The composition of claim 1 wherein upon
dilution to 10 wt% or less, the acid composition has a
pKa that ranges from about 1 to 3.

20

17. A solid block acid cleaner composition
comprising

(a) an effective amount of an acid cleaner
component, said acid cleaner component comprising a
25 mixture of an acid which is a solid at less than
about 40°C combined with an acid which is a liquid
at a temperature of less than about 40°C;

(b) an effective amount of a surfactant
composition, said surfactant composition comprising
30 a mixture of nonionic surfactant and anionic
surfactant, said nonionic surfactant comprising a
C₉₋₁₂ alkylphenol ethoxylate and said anionic
surfactant comprising a linear alkyl sulfate or
sulfonate; and

35 (c) an effective solidifying amount of a urea
compound;

wherein said composition has a pKa of less than about 6

upon dilution to 10 wt% (aqueous) or less.

18. The composition of claim 16 wherein said acid cleaner component is selected from the group consisting
5 of an inorganic acid, an organic acid, and mixtures thereof.

19. The composition of claim 17 wherein said inorganic acid is selected from the group consisting of
10 phosphoric acid, sulfuric acid, sulfamic acid, methyl sulfamic acid, hydrochloric acid, hydrobromic acid, nitric acid, and mixtures thereof.

20. The composition of claim 17 wherein said
15 organic acid is selected from the group consisting of hydroxyacetic acid, citric acid, formic acid, acetic acid, propionic acid, butyric acid, valeric acid, caproic acid, gluconic acid, itaconic acid, oxalic acid, malonic acid, succinic acid, glutaric acid, maleic acid,
20 fumaric acid, adipic acid or sokalan acid and mixtures thereof.

21. The composition of claim 17 wherein said solid acid comprises citric and said liquid acid comprises
25 glycolic, said liquid acid having an aqueous activity level ranging from about 60 to 80 wt% (w/v).

22. The composition of claim 9 wherein said nonionic surfactant is selected from the group
30 consisting of an ethoxylated-propoxylated copolymer, a nonyl phenol ethoxylate, and mixtures thereof.

23. The composition of claim 16 wherein said anionic surfactant is selected from the group consisting
35 of an alkyl sulfate or sulfonate anarylsulfate or sulfonate, an alkylarylsulfate or sulfonate, and mixtures thereof.

24. The composition of claim 16 wherein said surfactant composition comprises about 10 to 70 wt% of said acid cleaner composition; said surfactant composition further comprising about 10 to 60 wt% of an alkyl sulfonate and from about 60 to 10 wt% of a nonionic comprising a C₆₋₁₈ alcohol ethoxylate or a C₆₋₁₂ alkylphenol ethoxylate, the percentage based on the acid cleaner composition.

25. The composition of claim 16 wherein the acid composition has a pKa that ranges from about 1 to 3.

26. A solid block acid cleaner composition comprising:

(a) from about 40 to 50 wt-% of an acid source, said acid source comprising an acid that is a solid at any temperature less than 40°C said solid acid comprising citric and a liquid acid at less than about 40°C, said liquid acid comprising aqueous glycolic acid;

(b) from about 10 to 30 wt-% of a surfactant composition said surfactant composition comprising

- i. a nonionic selected from the group consisting of an alcohol ethoxylate or an alkylphenol ethoxylate, an EO-PO block polymer, and mixtures thereof, and
- ii. an anionic surfactant selected from the group consisting of an alkyl sulfate, a linear alkyl sulfonate, an alkyl benzene sulfonate, and mixtures thereof.

(c) from about 10 to 30 wt% of urea, wherein said solid block acid cleaning composition has a pKa ranging from about 1 to 3 upon dilution to 10 wt% or less.

27. A method of using an acid cleaner composition comprising an effective amount of an acid cleaner

component, an effective amount of a surfactant composition selected from the group consisting of an anionic surfactant, a nonionic surfactant or mixtures thereof, and an effective solidifying amount of a urea compound, the method comprising the steps of:

- (a) diluting said acid cleaner composition to a use-dilution concentration; and
- (b) applying the composition to the intended surface of use.

10

28. The method of claim 28 wherein upon dilution said acid cleaner composition is present in the diluent in an amount of 3,000 to 100,000 ppm.

15

29. The method of manufacturing a solid block acid cleaner composition, comprising:

- (a) forming a pourable liquid blend comprising an acid composition comprising a solid component and a liquid component; an effective amount of a surfactant composition; and an effective solidifying amount of urea; and
- (b) solidifying the blend in the container.

20

30. The method of claim 29 wherein the container comprises a disposal plastic capsule.

25

31. The method of claim 29 wherein the acid component comprises 0.1 to 45 wt% of a solid acid and 0.1 to 45 wt% of a liquid acid.

30

32. The method of claim 29 wherein the acid surfactant comprises a nonionic surfactant.

33. The method of claim 29 wherein the surfactant comprises a nonionic surfactant.

35

34. The method of claim 29 wherein the surfactant

comprises a blend of C₆₋₁₂ alkyl phenol ethoxylate having 4 to 15 molds of ethylene oxide and an anionic surfactant selected from the group consisting of a linear alkyl sulfonate or an alkyl benzene sulfonate.

5

35. The method of claim 29 wherein urea is present in an amount of 10 to 45 wt% based on the acid cleaner composition.

10

36. The method of claim 29 wherein after the portable liquid mixture is formed, the mixture is milled to reduce the particle size of the urea to less than about 1000 μ .

15

37. The method of claim 29 wherein after the portable liquid mixture is formed, the mixture is heated to a temperature sufficient to incorporate the urea into a uniform mixture.

20

38. The method of claim 29 wherein the portable liquid mixture is formed by first adding urea to a liquid composition comprising 0.1 to 50 wt% of the active ingredients of the composition to form a stub solution, and then combining the balance of the remaining ingredients with the stub solution.
